Product Overview

Package Contents

DWR-956M router

Power Adapter

Ethernet Cable

Quick Install Guide

If any of the above items are missing or damaged, please contact your reseller.

Note: Using a power supply other than the one included with the DWR-956M may cause damage and void the warranty for this product.

System Requirements

Network Requirements

- An active account with an Internet Service Provider using one of the following connection types:
- A Mobile connection using a SIM card
- A broadband device connected using the WAN port

Web-based Configuration Utility Requirements Computer with the following:

- Windows[®], Macintosh, or Linux-based operating system
- An installed Ethernet adapter

Browser Requirements:

- Internet Explorer 10 or higher
- Microsoft EDGE Browser 20 or higher
- Firefox 11 or higher
- Safari 5 or higher
- Chrome 17 or higher

Windows[®] Users: Make sure you have the latest version of Java installed. Visit version of Java installed. Visit www.java.com to download the latest version.

Introduction

The D-Link DWR-956M FIBRE / LTE WI-FI AC1200 DUAL BAND ROUTER with VOIP share your internet connection over blazing-fast Wireless AC. Equipped with advanced AC beamforming technology to maximize the speed and range of your wireless signal to significantly outperform 802.11n and other older, non-beamforming capable 802.11ac devices. It also has a Gigabit WAN port, one USB ports, and four Gigabit ports to provide speeds up to 10 times faster than standard 10/100 ports. Enjoy uninterrupted Internet service thanks to failover protection, the WAN port to connect to Ethernet based networks while the built-in SIM slots allows for mobile broadband zconnection. With the addition of Advanced Quality of Service (QoS), data streams are separated, which helps organize and prioritize your network traffic so your video streaming, gaming, and VoIP calls run smoother over both your wired and wireless network.

The DWR-956M FIBRE / LTE WI-FI AC1200 DUAL BAND ROUTER with VOIP provides incredible speeds, smart antenna technology, fast ports, and cloud features. It also features a clean design and easy installation options.

Features

Faster Wireless Networking -The DWR-956M is dual-band capable and equipped with four antennas to provide wireless speeds of up to 1200 Mbps* for your wireless devices. It operates on both the 2.4 GHz and 5GHz bands to allow separation of traffic so users can participate in high-bandwidth activities, such as video streaming, online gaming, and real-time audio, without affecting low-priority traffic like email and web surfing.

- **Compatible with 802.11n/g/b/a devices** - The DWR-956M is still fully compatible with the 802.11n, 802.11g, and 802.11a standards, so it can connect with existing 802.11n, 802.11g, 802.11b, and 802.11a wireless devices.

- **Advanced Firewall Features** - The web-based user interface allows you to configure a number of advanced network management features including:

- **Content Filtering** - Easily apply content filtering based on MAC address, URL, and/or domain name.

- **Scheduling** - The wireless features can be scheduled to be active on a schedule you define.

- **Multiple/Concurrent VPN Sessions** - The DWR-956M can pass through VPN sessions. It supports multiple and concurrent IPSec and PPTP sessions, so users behind the DWR-956M can access encrypted corporate networks.

- **User-friendly Setup Wizard** - Through its easy-to-use web-based user interface, the DWR-956M lets you control what information is accessible to those on the wireless network, whether from the Internet, or from your company's server. Configure your router to your specific settings within minutes.

* Maximum wireless signal rate derived from IEEE Standard 802.11a, 802.11b, 802.11g, 802.11n, and 802.11ac specifications. Actual data throughput will vary. Network conditions and environmental factors, including volume of network traffic, building materials and construction, and network overhead, lower actual data throughput rate. Environmental conditions will adversely affect wireless signal range.

Hardware Overview

Back Panel

1.	Power Button	Press to switch router ON/OFF
2.	Power Connector	Connector for the supplied power adapter.
3.	Ethernet Ports	Connects to Ethernet devices such as computers.
4.	WAN Port	Connects to Ethernet WAN devices.
5.	FXS VoIP port	Connects to an analogue telephone.

Hardware Overview

Side Panel

6.	USB 3.0 Port	Connect to USB Storage Device
7.	Reset Button	Press and Hold the Reset button for 25 seconds to reset the DWR-956M
8.	WPS Button	Press to start the WPS process and automatically create an encrypted connection to a WPS client.

Hardware Overview

LEDs

1.	Power	Solid Blue	Device is powered on.
2.	WAN	Solid Blue	The WAN is properly connected.
		Blinking Blue	The WAN is properly connected and data is being transmitted.
		OFF	No connection or Cable not connected properly.
3.	LAN 1,2,3,4	Solid Blue	A device is connected to the Ethernet port.
		Blinking Blue	A device is connected to the Ethernet port and data is being transmitted.
		OFF	Nothing is connected to the Ethernet port.

4.	WiFi 2.4Ghz/5Ghz	Blinking Blue	Enabled and data is being transmitted.
		Solid Blue	Enabled and no data is being transmitted.
		OFF	WiFi is turned OFF
5.	WPS	Blinking Blue	WPS pairing mode active.
		Solid Blue	WPS enabled, paired with WPS client
		OFF	WPS disabled.
6	USB	Solid Blue	USB storage device connected
		OFF	No USB device connected or USB not detected.
7.	LTE Signal	Red	No Internet connection or SIM not reading.
		Orange	Device is connected to 2G service.
		Green	Device is connected to 3G Service.
		Blue	Device is connected to 4G service.
		OFF	LTE connection disabled.
8.	Phone Service	Green	Device is using CS dial mode
		Blue	Device is using VoIP dial mode
		OFF	NO voice service is detected

Installation

This section will walk you through the installation process. Placement of the router is very important. Do not place the router in an enclosed area such as a closet, cabinet, attic, or garage.

Note: This installation section is written for users who are setting up their home Internet service with the DWR-956M FIBRE / LTE WI-FI AC1200 DUAL BAND ROUTER with VOIP for the first time. If you are replacing an existing modem and/or router, you may need to modify these steps.

Before you begin

- Make sure to have your Fibre service information provided by your Internet Service Provider handy. This information is likely to include your Fibre account's Username and Password. Your ISP may also supply you with additional WAN configuration settings which are necessary to establish a connection. This information may include the connection type (DHCP IP, Static IP, PPPoE, or PPPoA) and/or ATM PVC details.
- If you are connecting a considerable amount of networking equipment, it may be a good idea to take the time to label each cable or take a picture of your existing setup before making any changes.
- We suggest setting up your DWR-956M from a single device and verifying that it is connected to the Internet before connecting additional devices.

Wireless Installation Considerations

The D-Link wireless router lets you access your network using a wireless connection from virtually anywhere within the operating range of your wireless network. Keep in mind that the number, thickness and location of walls, ceilings, or other objects that the wireless signals must pass through may limit the range. Typical ranges vary depending on the types of materials and background RF (radio frequency) noise in your home or business. The key to maximizing wireless range is to follow these basic guidelines:

1. Keep the number of walls and ceilings between the D-Link router and other network devices to a minimum - each wall or ceiling can reduce your adapter's range from 3-90 feet (1-30 meters.) Position your devices so that the number of walls or ceilings is minimized.
2. Be aware of the direct line between network devices. A wall that is 1.5 feet thick (0.5 meters), at a 45-degree angle appears to be almost 3 feet (1 meter) thick. At a 2-degree angle it looks over 42 feet (14 meters) thick! Position devices so that the signal will travel straight through a wall or ceiling (instead of at an angle) for better reception.
3. Building materials make a difference. A solid metal door or aluminum studs may have a negative effect on range. Try to position access points, wireless routers, and computers so that the signal passes through drywall or open doorways. Materials and objects such as glass, steel, metal, walls with insulation, water (fish tanks), mirrors, file cabinets, brick, and concrete will degrade your wireless signal.
4. Keep your product away (at least 3-6 feet or 1-2 meters) from electrical devices or appliances that generate RF noise.
5. If you are using 2.4 GHz cordless phones or X-10 (wireless products such as ceiling fans, lights, and home security systems), your wireless connection may degrade dramatically or drop completely. Make sure your 2.4 GHz phone base is as far away from your wireless devices as possible. The base transmits a signal even if the phone is not in use.

Manual Setup

Hardware Installation

01

Connect the Ethernet cable supplied with your Fibre device (ONT) to a LAN port on the ONT. Then connect the other end of the cable to the blue WAN port on the back of the router.

If you have a Fibre service

OR

01

If you have a LTE service

A. Flip the router upside down and open the flap at the bottom.

B. Press down and slide the SIM card holder to the right, then flip open the tray.

C. Slide the SIM card into the open tray with the gold contact points facing up.

D. Close the tray, press down and slide the SIM card holder to the left to lock it into place. Then restore the flap at the back of the router.

02

Connect the power connector of the power supply to the power socket at the back of the router.

Plug the power supply into the wall outlet. Switch the wall outlet and the router on.

03

You can set up your router using Wi-Fi an Ethernet cable or APP.

Ethernet cable:

Connect the yellow RJ-45 Ethernet cable to any yellow LAN port at the back of the router and the other end into your PC LAN port.

D-Link ZA App

Download and use the D-Link ZA App to setup and manage yo router settings.

Wi-Fi:

Use the default Wi-Fi SSID and password (WPA Key) printed or the bottom of the router to connect your Wi-Fi enabled device to the router.

04

If you are using an Ethernet cable / Wi-Fi to complete the setup:

Launch an Internet browser (Google Chrome, Firefox, Internet Explorer, Safari, etc.) on your connected device.

In the URL web address field, type **10.0.0.2** and press enter.

The Quick Setup wizard will start automatically. Please follow the steps of the wizard to finish the configuration of the router

Getting Started

To set up the Internet connection without using the Quick Setup Wizard on the router, refer to **Basic Setup on page 44**

To connect to the web interface of the router and get started setting it up, refer to **Configuration on page**.

Quick Setup

Step 1

The Quick Setup menu is used to set up the Internet connection on the DWR-956M. This is the first step in the Quick Setup tool and allows you to choose the connection type.

Step 1: Select Interface

Type: Please select which WAN interface to use: 3G/4G or ETH. Your ISP should inform you of what method you use to connect to the Internet.

Click **Next** to continue.

Quick Setup

step1 -> step2 -> step3 -> step4 -> step5 -> step6 -> step7 -> step8 -> step9

Please select which WAN interface to use: 3G/4G or Ethernet WAN,

then click the 'test' button to detect if the hardware interface is correctly connected.

Select Interface Type:

Step 2

Auto detecting

3G/4G will use DHCP, or IF you are on Fibre you will use either PPPoE or DHCP connection.

If PPPoE or DHCP is successful, please click the next button to continue to next step.

If both DHCP and PPPoE test fails,

For SIM card: please verify sim card connectivity (whether the SIM card is active and inserted correctly)

For Fibre: please verify that your fibre is active and the cable from the ONT device is plugged into the blue port at the back of the DWR-956M

Quick Setup

Auto detecting. This may take a while, please wait patiently...

[Back](#) [Reset](#)

step1 -> **step2** -> step3 -> step4 -> step5 -> step6 -> step7 -> step8

Auto detect success, PPP account test passed! Suggest you choose PPPoE, Please click 'Next'.

Select Mode:

[Back](#) [Reset](#) [Next](#)

Quick Setup

step1 -> **step2** -> step3 -> step4 -> step5 -> step6 -> step7 -> step8

Auto detect complete. Both DHCP and PPP account test fail! Please click the Reset button to reset to factory defaults, and then restart this wizard after the reset.

Select Mode:

[Back](#) [Reset](#) [Next](#)

Step 3

IF PPPoE Passed then user will need to enter the Username and Password as provided by the Internet Service Provider (ISP). IF DHCP passed device will automatically skip to step 5.

Username: Enter your Username here. (usually looks like an email address like Yourname@telkomsa.net)

Password: Enter your Password here.

Confirm Password: Enter the same password again here.

step1 -> step2 -> **step3** -> step4 -> step5 -> step6 -> step7 -> step8

Please enter your Username and Password as provided by your ISP (Internet Service Provider). Click 'Next' to continue.

User Name:

Password:

Confirm Password:

Note: Using admin for the username & password will not work on this step as this is the account details for your Fibre line, which is unique to each client's account.

Step 4.

If connection is on PPPoE device will now test if the configured account is valid. If the test fails, please click on the back button and double check that the details on step 3 are correct. If the details have been entered correctly and step 4 still fails, please contact your Internet Service Provider and request for them to send you new PPPoE details.

step1 -> step2 -> step3 -> **step4** -> step5 -> step6 -> step7 -> step8

This may take a while, please wait patiently...

Step 5

On Step 5 the user will be able to modify the WiFi SSID and Preshare Key to their requirements.

SSID 2.4GHz: The name of the Wi-Fi network operating on 2.4GHz.

Preshare key: The password for the Wi-Fi network operating on 2.4GHz.

SSID 5GHz: The name of the Wi-Fi network operating on 5GHz.

5G WPA Preshare key: The password for the Wi-Fi network operating on 5GHz.

Click **Back** to go back to the pervious page, click **Skip** to skip this configuration or click **Next** to continue to **Step 6**.

step1 -> step2 -> step3 -> step4 -> **step5** -> step6 -> step7 -> step8

SSID 2.4GHz:	<input type="text" value="dlink-956M-2.4G-9d42"/>
2.4G WPA Preshare key:	<input type="password" value="....."/>
SSID 5GHz:	<input type="text" value="dlink-956M-5.8G-9d42"/>
5G WPA Preshare key:	<input type="password" value="....."/>

Back **Skip** **Next**

Step 6

In this step you can enter the change the web UI credentials. (The details used to log into the settings page of your router on 10.0.0.2)

AdminName: The username to log in to the web UI.

AdminPassword: Enter the password here for logging into the web UI.

AdminPassword: Enter the password for logging in to the web UI again to confirm.

Note: Password cannot contain a space.

Click **Back** to go back to the pervious page, click **Skip** to skip this configuration (not recommended for security purposes) or click **Next** to continue to **Step 8**.

step1 -> step2 -> step3 -> step4 -> step5 -> **step6** -> step7 -> step8

Use the fields below to enter up to 15 characters and click "Apply" to change or create passwords.

Note: Password cannot contain a space.

AdminName:	<input type="text" value="admin"/>
AdminPassword:	<input type="password"/>
Confirm AdminPassword:	<input type="password"/>

Back **Skip** **Next**

Step 7

In this step you can enter the Site Username, Site Password, Confirm Site Password and Site LAN IP/Netmask to connect to Telkom VPN lite

Site Username: The site username.

Site Password: Enter the site password here.

Confirm Site Password: Enter the site password again to confirm.

Site LAN IP/ Netmask: Enter the LAN IP or Netmask for the site here.

Note: Password cannot contain a space.

Click **Back** to go back to the pervious page or click **Next** to continue to **Step 9**.

Step 8

In this step you can you can review everything for accuracy.

Click **Back** to go back to the pervious page or click Apply to apply all of the configuration settings.

step1 -> step2 -> step3 -> step4 -> step5 -> step6 -> **step7** -> step8

If you are a Telkom VPN Lite Customer, you can configure it here. Your PC's IP address needs to renew after the wizard is done - please disconnect your PC and then reconnect it.

If you're not a Telkom VPN Lite customer you can click "Skip" to continue.

Site Username:
Site Password:
Confirm Site Password:
Site LAN IP/Netmask: (Format: A.A.A.A/B(A:0-255,B:1-32))

Back **Skip** **Next**

Setup complete.

Click "Back" to review or modify settings.

Click "Apply" to apply the current settings.

If your Internet connection does not work after you pressed apply, you can try the Setup Wizard again with alternative settings or use Manual Setup instead if you have your Internet connection details as provided by your ISP.

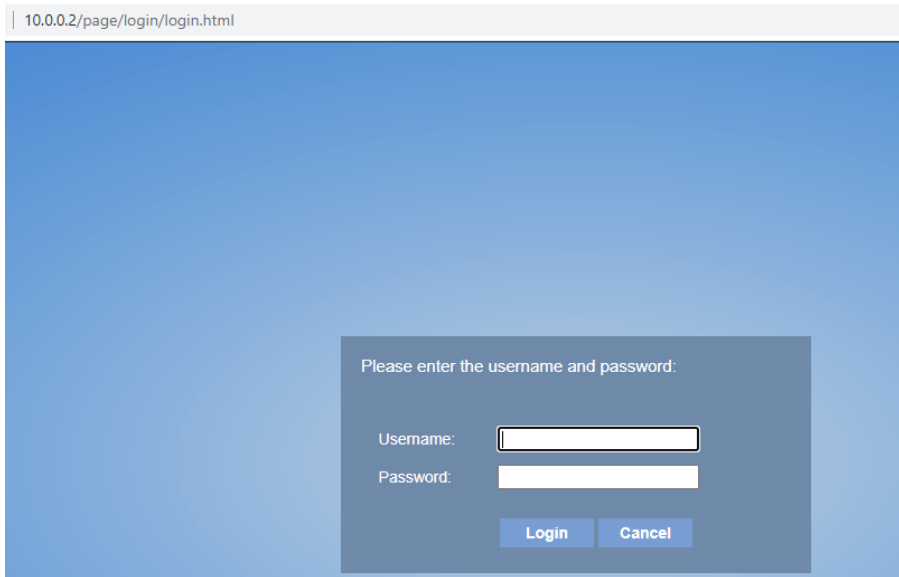

Site Username:	
Site Password:	
Site LAN IP/Netmask:	/
Web Login Name:	admin
Web Login Password:	admin1
SSID 2.4GHz:	dlink-956M-2.4G-9d42
2.4G WPA Preshare key:	neifq89695
SSID 5GHz:	dlink-956M-5.8G-9d42
5G WPA Preshare key:	neifq89695

Back **Apply**

Configuration

Log in

To access the web interface, open a web browser and enter the IP address of the router (by default this is **10.0.0.2**) into the address bar. When the login page of the DWR-956M is displayed, enter the username and password you set on step 6 of the setup wizard. By default the login details are **admin** for the username and **admin** for the password if you chose to not change the details on the wizard. Click **Log In** to proceed or **Cancel** to clear your input.

10.0.0.2/page/login/login.html

Please enter the username and password:

Username:

Password:

Login Cancel

Note: If you cannot remember your password or cannot log in, follow the factory reset procedure to restore the router to its default settings. The web interface is used to set up and change settings on the DWR-956M. Follow the steps below to access the web interface and start setting up the DWR-956M.

Status

Device Information

The Status menu is used to display statistics from different functions from the router. This displays basic system information and the uptime of the router.

Device Information

Product Type: The model number of the router.

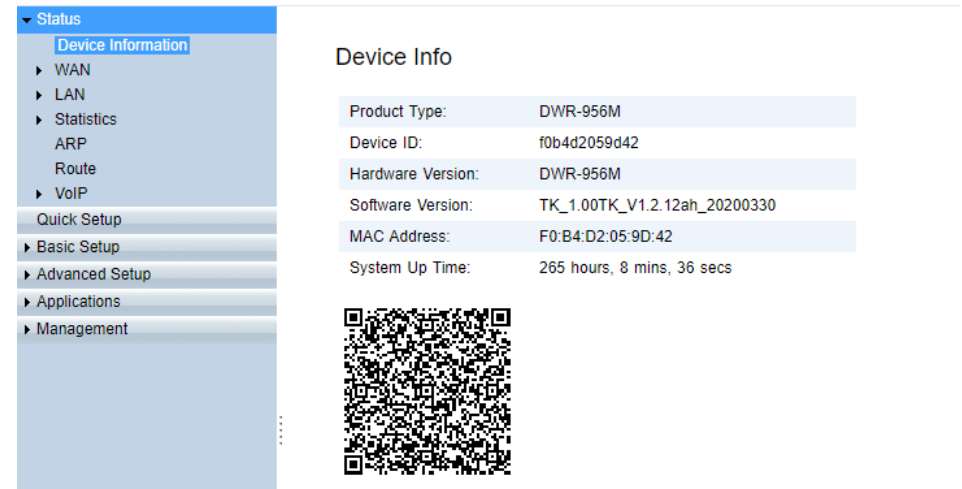

Device ID: The device ID of the router.

Hardware Version: The hardware version of the router.

Software Version: The software version of the router.

MAC Address: The MAC address of the router.

System Up Time: The amount of time that the router has been on for.

The screenshot shows the router's web interface. On the left is a navigation menu with the following items: Status (expanded), Device Information (highlighted), WAN, LAN, Statistics, ARP, Route, VoIP, Quick Setup, Basic Setup, Advanced Setup, Applications, and Management. The main content area displays the 'Device Info' page with the following details:

Product Type:	DWR-956M
Device ID:	f0b4d2059d42
Hardware Version:	DWR-956M
Software Version:	TK_1.00TK_V1.2.12ah_20200330
MAC Address:	F0:B4:D2:05:9D:42
System Up Time:	265 hours, 8 mins, 36 secs

Below the table is a QR code.

WAN

Network

This displays Network status information.

IPv4 / IPv6 WAN Connection Status

Connection Name: The name of the WAN connection.

Type: The WAN connection type.

IP Address/Mask: The IP address and subnet mask of the WAN connection.

Default Gateway: The default gateway of the WAN connection.

Primary DNS: The primary DNS of the WAN connection.

Secondary DNS: The secondary DNS of the WAN connection.

Status: The status of the WAN connection.

IPv4 WAN Connection Status

Connection Name	Type	IP Address/Mask	Default Gateway	Primary DNS	Secondary DNS	Status
DHCP_WAN_ETH	DHCP	/				Connecting
PPPoE_WAN_ETH	PPP	105.186.219.43/255.255.255.255	105.184.43.1	196.43.42.190	196.43.50.190	Connected
LTE	DHCP	/				Disconnected

IPv6 WAN Connection Status

Connection Name	Type	IP Address	Default Gateway	Primary DNS	Secondary DNS	Prefix	Status
No Rule Found!							

DS-Lite Status

Connection Name: The name of the DS-Lite connection.

Type: The DS-Lite connection type.

Mode: The DS-Lite mode of the DS-Lite connection.

AFTR Address: The AFTP address of the DS-Lite connection.

Status: The status of the DS-Lite connection.

L2TP LAC Status

Connection Name: The name of the DS-Lite connection.

Type: The WAN connection type.

IP Address/Mask: The IP address and subnet mask of the WAN connection.

Default Gateway: The default gateway of the WAN connection.

Primary DNS: The primary DNS of the WAN connection.

Secondary DNS: The secondary DNS of the WAN connection.

Status: The status of the DS-Lite connection.

Click **Refresh** to refresh the page.

L2TP LNS Status

Connection Name: The name of the WAN connection. Type the WAN connection type.

IP Address/Mask: The IP address and subnet mask of the WAN connection.

Default Gateway: The default gateway of the WAN connection.

Primary DNS: The primary DNS of the WAN connection.

Secondary DNS: The secondary DNS of the WAN connection.

Status: The status of the WAN connection.

Click **Refresh** to refresh the page.

DS-Lite Status

Connection Name	Type	Mode	AFTR Address	Status
DHCP_WAN_ETH	DHCP	Auto		Disconnected
PPPoE_WAN_ETH	PPP	Auto		Disconnected

L2TP LAC Status

Connection Name	Type	IP Address/Mask	Default Gateway	Client WAN IP	Server WAN IP	Status
No Rule Found!						

L2TP LNS Status

Connection Name	Type	IP Address/Mask	Status	Authentication Mode	User Name
	PPP	/	Disconnected		

Ethernet

This displays Ethernet status information.

Statistics -- WAN

Status: The status of the Ethernet connection.

Speed: The speed of the Ethernet connection.

Duplex: The duplex of the Ethernet connection.

Received: The number of bytes and packets received on the Ethernet connection.

Transmitted: The number of bytes and packets sent on the Ethernet connection.

Click **Refresh** to refresh the page.

Statistics -- WAN

Status	Speed	Duplex	Received		Transmitted	
			Bytes	Packets	Bytes	Packets
Up	1000Mb/s	Full Duplex	590465912	463648	1736711	8492

Refresh

3G/4G

This displays xDSL status information.

Status: The status of the 3G/4G connection.

Provider: Shows the Network Provider for the SIM connection.

Network Type: The connection type

Signal: The signal strength for the connection

Cell id: IMEI number for the DWR-956M

Click **Refresh** to refresh the page.

Statistics -- WAN

Status	Provider	Network type	Signal	Cell id
Registered	Telkom-StayHomeSA	LTE		354586100737774

IPv6 Configuration

This allows you to set the IP address settings and DHCP options for IPv6.

RA Period Settings

Max Period: The maximum period between Router Advertisement (RA) messages.

The default is 15 seconds.

Min Period: The minimum period between Router Advertisement (RA) messages.

The default is 10 seconds.

M/O Flag Settings

M/O Flag Mode: The mode for the Managed Address Configuration Flag (M Flag) and the Other Stateful Configuration Flag (O Flag). This can be **Auto** or **Manual**. The default is **Auto**.

M Flag: Whether to enable or disable the the Managed Address Configuration Flag (M Flag). This is only available when M/O Flag Mode is set to Manual. Set this to **1** to enable the M Flag, and set it to **0** to disable it.

O Flag: Whether to enable or disable the the Other Stateful Configuration Flag (O Flag). This is only available when M/O Flag Mode is set to Manual. Set this to **1** to enable the O Flag, and set it to **0** to disable it.

DHCPv6 Server: Whether to enable or disable the DHCPv6 server. Tick this to enable the DHCPv6 server, or un-tick it to disable it. This default is ticked.

Unique Local Prefix: Whether to use a Unique Local Prefix for the private network. Tick this to enable the Unique Local Prefix. This default is ticked.

Unique Local GlobalID: The Unique Local Global ID to use on the private network. This is 40-bit number and is globally unique. The default is: 11:22:33:44:55.

Prefix: The method through which to assign a network prefix to clients on the LAN. This can be **Prefix Delegation** or **Static**. If Static is chosen then a prefix and prefix mask can be entered.

LAN Address Mode: The method through which to assign IP addresses to clients on the LAN. This can be **SLAAC** or **DHCPv6**.

LAN DNS Mode: The method through which to assign DNS information to clients on the LAN. This can be **Obtain From WAN**, **DNS Proxy** or **Static**.

DNS: The static DNS server to assign to IPv6 clients.

Click **Apply** to apply the settings and click **Refresh** to refresh the page.

Wireless Security Setting

This allows you to set the security settings for the wireless network.

Wireless Security Setting

Choose SSID: The SSID that you wish to modify. This can be from SSID1 to SSID8. SSID 1-4 is for 2.4GHz and SSID 5-8 is for 5GHz.

Authentication: The authentication type to use with the SSID.

This can be **None**, **WEP**, **WPA-PSK**, **WPA2-PSK**, **WPA-PSK/WPA2-PSK MIXED**, or **802.1X**.

Choosing the **WEP**, **WPA-PSK**, **WPA2-PSK**, **WPA-PSK/ WPA2-PSK MIXED**, or **802.1X** option displays other options on the page, and these are documented below.

WPA Preshare key: This is the pre-shared key that clients authenticating with WPA will need to supply in order to connect to the SSID.

Encryption Mode: The encryption mode for the SSID. This can be **AES**, **TKIP** or **TKIP+AES**.

Authentication: WEP Encryption Mode: The encryption mode for the SSID. This can be **Open**, **Share**, or **Both**.

Encryption Length: The length of the encryption key for the SSID.

This can be **4 bits (10 hex digits)** or **128 bits (26 hex digits)**.

Key Index: The default key to use for authentication. The keys are numbered **1** to **4** and are listed below.

Key1: Authentication key 1. The SSID simultaneously supports up to 4 keys.

Key2: Authentication key 2. The SSID simultaneously supports up to 4 keys.

Key3: Authentication key 3. The SSID simultaneously supports up to 4 keys.

Key4: Authentication key 4. The SSID simultaneously supports up to 4 keys.

Authentication: 802.1X

Radius Server Address: The RADIUS server IP address to use for authentication.

Radius Server Port: The RADIUS server port to use for authentication.

Wireless

The WAN menu is used to set advanced wireless settings on the DWR-956M.

Wireless Advanced Configuration 2.4GHz

This allows you to set wireless settings for the 2.4 GHz wireless band.

Wireless Advanced Configuration 2.4GHz

Mode: The wireless mode. This can be **802.11b**, **802.11g**, **802.11b/g**, **802.11n**, **802.11n/g**, or **802.11b/g/n**.

Choosing the **802.11n**, **802.11n/g**, **802.11b/g/n** option displays other options on the page, and these are documented below.

Rate: The rate at which to transmit and receive on. This can be **Auto**, **1 Mbps**, **2 Mbps**, **5.5 Mbps**, **11 Mbps**, **6 Mbps**, **9 Mbps**, **12 Mbps**, **18 Mbps**, **24 Mbps**, **36 Mbps**, **48 Mbps**, **54 Mbps**, **MCS0**, **MCS1**, **MCS2**, **MCS3**, **MCS4**, **MCS5**, **MCS6**, **MCS7**, **MCS8**, **MCS9**, **MCS10**, **MCS11**, **MCS12**, **MCS13**, **MCS14**, or **MCS15**. The default is **Auto**.

Rx Chain Power Save: The RX Chain Power Save feature turns one of the receive chains off to save power.

TX Power: The transmit power of the wireless radio.

This can be **100%**, **80%**, **50%**, **30%**, or **10%**. The default is **100%**.

Choose Country: Default is set to ZA

Channel: The channel to operate on. This can be **Auto**, **1**, **2**, **3**, **4**, **5**, **6**, **7**, **8**, **9**, **10**, **11**, **12**, or **13**. The default is **Auto**.

Current Channel: This displays the current channel that the wireless radio is operating on.

Auto Channel Timer: Specifies the time interval (in hours) of auto channelling.

Wireless Advanced Configuration 2.4GHz

Port Filter Rule Settings

This allows you to add packet-filtering rules on the DWR-956M.

Port Filter Rule Settings

IP Version: The IP version to match with the rule. This can be **IPv4** or **IPv6**.

Connection: The WAN connection to use with the packet filtering rule.

Description: The description to use for the packet filtering rule.

Enable: Whether to enable or disable the packet filtering rule.

Tick this to enable the packet filtering rule. The default is un-ticked.

Protocol: The protocol to use for the packet filtering rule.

This can be **ALL**, **TCP**, **UDP**, **ICMP** or **TCP/UDP**.

Source IP: The source IP to use for the packet filtering rule.

Source Port: The source port to use for the packet filtering rule.

Destination IP: The destination IP to use for the packet filtering rule.

Destination Port: The destination port to use for the packet filtering rule.

Click **Back** to go back to the previous page, click **Apply** to apply the settings and click **Refresh** to refresh the page.

MAC Filter

This allows you to set up MAC-filtering rules on the DWR-956M.

MAC Filter

Enable: Whether to enable or disable MAC filtering. Tick this to enable MAC filtering. The default is un-ticked.

Filter Mode: Whether to permit (whitelist) or deny (blacklist) MAC addresses as part of the MAC filter rule. This can be **Whitelist** or **Blacklist**.

MAC List

MAC Address: The MAC address to add to the MAC filtering rule.

Click Add to add the rule.

Click **Apply** to apply the settings and click **Refresh** to refresh the page.

Port Filter Rule Settings

Tools

Ping

The Tools menu is used to perform connectivity tests on the DWR-956M. This is used to perform ping tests. The results are displayed below the ping test options.

Host: The host to send the ICMP message to.

Repeat Number: The number of times to repeat the ping test.

Timeout (milliseconds):

The amount of time to wait before deciding that the ping test has failed.

Packet Size: This size of the ICMP packet.

Protocol Type: The protocol type to perform the ping test using.

This can be **IPv4** or **IPv6**.

WAN Connection: The WAN connection to use for the ping test.

Click **Ping** to perform the ping test and click **Refresh** to refresh the page.

Trace

This is used to perform traceroute tests. The results of the test are displayed below the traceroute test options.

Host: The host to send the ICMP messages to.

Max TTL: The maximum Time to Live (TTL) for the ICMP messages.

The is the maximum number of hops that an ICMP packet can pass through before the target host being declared unreachable.

This can be from **1** to **128**. The default is 30.

Waiting Time: The amount of time to wait before deciding that the host is not replying to ICMP messages.

WAN Connection: The WAN connection to use for the traceroute.

Click **Trace** to perform the traceroute and click **Refresh** to refresh the page.

Connect a Wireless Client to your Router

WPS Button

The easiest way to connect your wireless devices to the router is with WPS (Wi-Fi Protected Setup). Most wireless devices such as wireless adapters, media players, Blu-ray DVD players, wireless printers and cameras will have a WPS button (or a software utility with WPS) that you can press to connect to the DWR-956M router. Please refer to your user manual for the wireless device you want to connect to make sure you understand how to enable WPS. Once you know, follow the steps below:

Step 1 - Press the WPS button on the DWR-956M for about 1 second. The WPS LED on the front will start to blink.

Step 2 - Within 2 minutes, press the WPS button on your wireless device (or launch the software utility and start the WPS process).

Step 3 - Allow up to 1 minute for your connection to be configured. Once the WPS LED stops blinking, you will be connected and your wireless connection will be encrypted with WPA2.

Windows[®] 10

When connecting to the DWR-956M wirelessly for the first time, you will need to input the wireless network name (SSID) and Wi-Fi password (security key) of the device you are connecting to. If your product has a Wi-Fi configuration card, you can find the default network name and Wi-Fi password here. Otherwise refer to the product label for the default Wi-Fi network SSID and password, or enter the Wi-Fi credentials set during the product configuration.

1. To join an existing network, locate the wireless network icon in the taskbar, next to the time display and click on it.
2. Clicking on this icon will display a list of wireless networks which are within range of your computer. Select the desired network by clicking on the SSID.
3. To connect to the SSID, click **Connect**.
4. To automatically connect with the router when your device next detects the SSID, click the **Connect Automatically** check box.
5. You will then be prompted to enter the Wi-Fi password (network security key) for the wireless network. Enter the password into the box and click **Next** to connect to the network. Your computer will now automatically connect to this wireless network when it is detected.
6. You can also use Wi-Fi Protected Setup (WPS) to connect to the router. Press the WPS button on your D-Link device and you will be automatically connected.

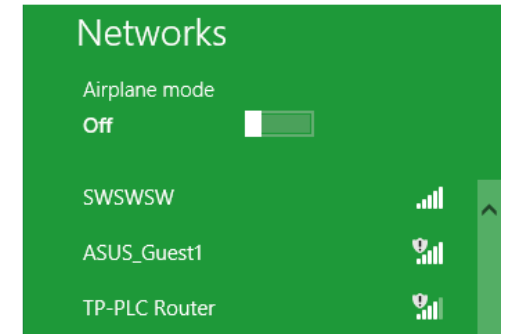

Wireless Icon

Windows® 8

It is recommended that you enable wireless security (WPA/WPA2) on your wireless router or access point before configuring your wireless adapter. If you are joining an existing network, you will need to know the security key (Wi-Fi password) being used.

1. To join an existing network, locate the wireless network icon in the taskbar next to the time display.
2. Clicking on this icon will display a list of wireless networks that are within connecting proximity of your computer. Select the desired network by clicking on the network name.
3. You will then be prompted to enter the network security key (Wi-Fi password) for the wireless network. Enter the password into the box and click **Next**.
4. If you wish to use Wi-Fi Protected Setup (WPS) to connect to the router, you can also press the WPS button on your router during this step to enable the WPS function.
5. When you have established a successful connection to a wireless network, the word **Connected** will appear next to the name of the network to which you are connected to.

Windows[®] 7

It is recommended that you enable wireless security (WPA/WPA2) on your wireless router or access point before configuring your wireless adapter. If you are joining an existing network, you will need to know the security key or passphrase being used.

1. Click on the wireless icon in your system tray (lower-right corner).

Wireless Icon

2. The utility will display any available wireless networks in your area.

3. Highlight the wireless connection with Wi-Fi name (SSID) you would like to connect to and click the **Connect** button.

If you get a good signal but cannot access the Internet, check your TCP/IP settings for your wireless adapter. Refer to the Networking Basics section in this manual for more information.

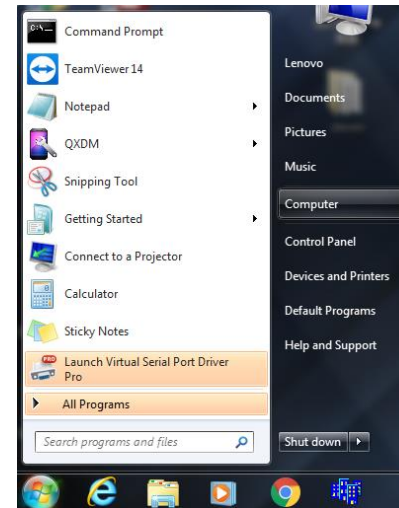

4. The following window appears while your computer tries to connect to the router.

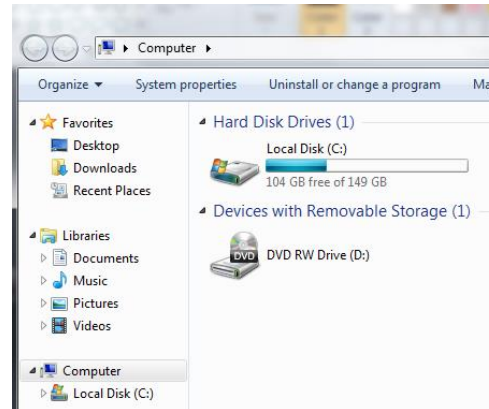

WPS

The WPS feature of the DWR-956M can be configured using WindowsR 7. Carry out the following steps to use WindowsR 7 to configure the WPS feature:

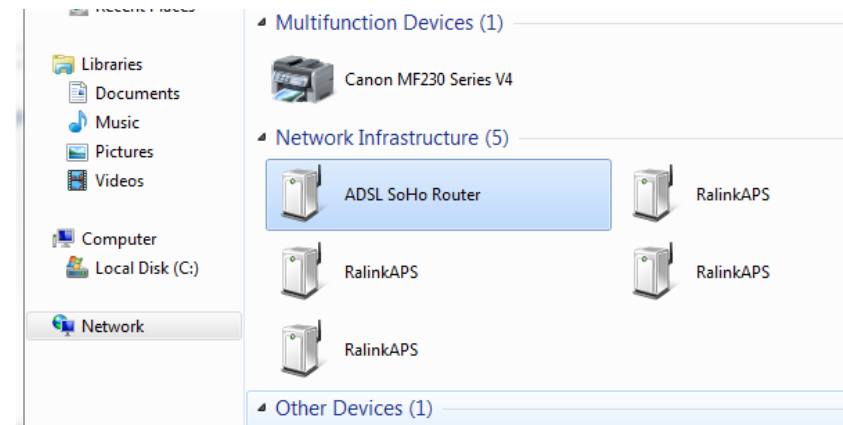

1. Click the **Start** button and select **Computer** from the Start menu.

2. Click **Network** on the left side.

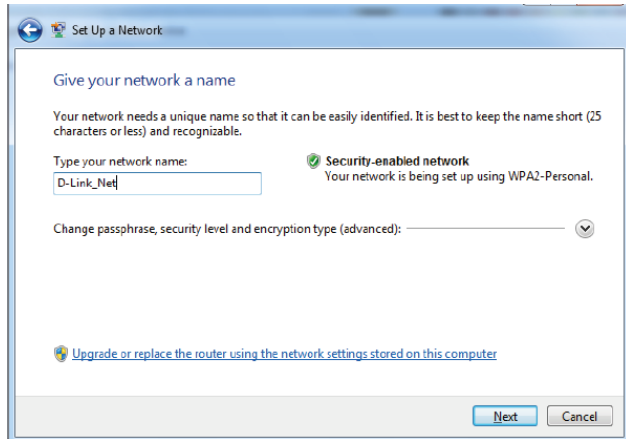

3. Double-click the DWR-956M (Will be displayed as RalinkAPS).

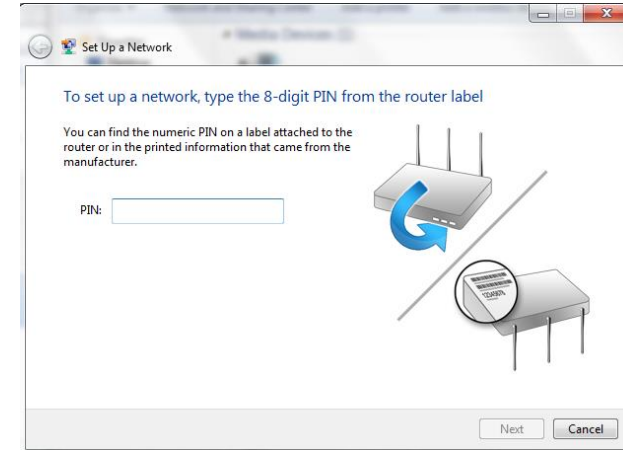

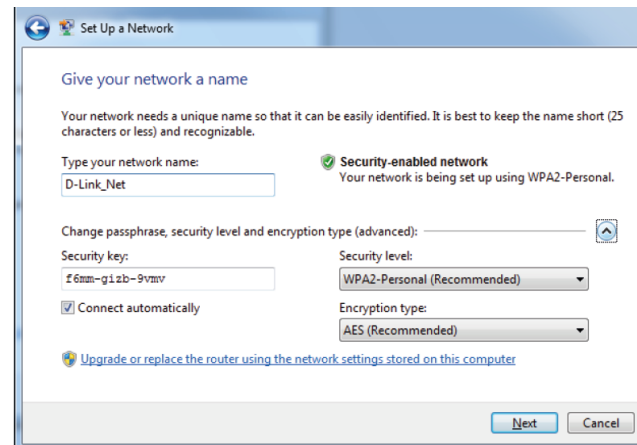

4. Input the WPS PIN number (on the router label) in the **Setup > Wireless Setup** menu in the Router's Web UI) and click **Next**.

5. Type a name to identify the network.

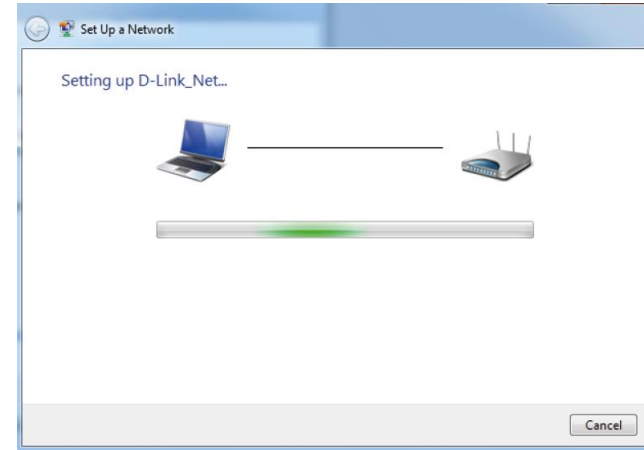

6. To configure advanced settings, click the Arrow icon.

Click **Next** to continue.

7. The following window appears while the DWR-956M is being configured.

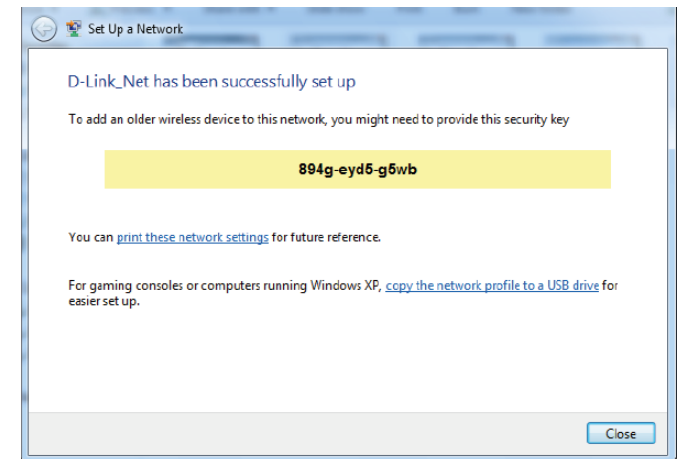

Wait for the configuration to complete.

8. The following window informs you that WPS on the DWR-956M has been set up successfully.

Make a note of the security key as you may need to provide this security key if adding an older wireless device to the network in the future.

9. Click **Close** to complete WPS setup.

Troubleshooting

This chapter provides solutions to problems that can occur during the installation and operation of the DWR-956M. Read the following descriptions if you are having problems. The examples below are illustrated in WindowsR XP. If you have a different operating system, the screenshots on your computer will look similar to these examples.

1. Why can't I access the web-based configuration utility?

When entering the IP address of the D-Link router (**10.0.0.2** for example), make sure you are not connected to a website, you don't have to be connected to the Internet. The device has the utility built-in to a ROM chip in the device itself. Your computer must be on the same IP subnet to connect to the web-based utility.

- Make sure you have an updated Java-enabled web browser. We recommend the following:
 - Microsoft Internet ExplorerR 10 or higher
 - Microsoft EDGE Browser 20 or higher
 - Mozilla Firefox 11 or higher
 - Google™ Chrome 17 or higher
 - Apple Safari 5 or higher
- Verify physical connectivity by checking for solid LAN lights on the device. If you do not get a solid LAN light, try using a different cable, or connect to a different port on the device. If the computer is turned off, the link light may not be on.
- Disable any Internet security software running on the computer. Software firewalls such as ZoneAlarm, BlackICE, Sygate, Norton Personal Firewall, and WindowsR XP firewall may block access to the configuration pages. Check the help files included with your firewall software for more information on disabling or configuring it.
- Configure your Internet settings:
 - Go to **Start > Settings > Control Panel**. Double-click the **Internet Options** icon. From the **Security** tab, click the button to restore the settings to their defaults.
 - Click the **Connection** tab and set the dial-up option to Never Dial a Connection. Click the LAN Settings button. Make sure nothing is checked. Click **OK**.
 - Go to the **Advanced** tab and click the button to restore these settings to their defaults. Click **OK** three times.
 - Close your web browser (if open) and open it.

- Access the web management. Open your web browser and enter the IP address of your D-Link router in the address bar. This should open the login page for your web management.
- If you still cannot access the configuration, unplug the power to the router for 10 seconds and plug back in. Wait about 30 seconds and try accessing the configuration. If you have multiple computers, try connecting using a different computer.

2. What can I do if I forgot my password?

If you forgot your password, you must reset your router. This process will change all your settings back to the factory defaults.

To reset the router, locate the reset button (hole) on the rear panel of the unit. With the router powered on, press and hold the the rest button down for 20-25 seconds. Release the button and the router will go through its reboot process. Wait about 30 seconds to access the router. The default IP address is **10.0.0.2**. When logging in, the default username is admin and the default password it admin.

3. Why can't I connect to certain sites or send and receive emails when connecting through my router?

If you are having a problem sending or receiving email, or connecting to secure sites such as eBay, banking sites, and Hotmail, we suggest lowering the MTU in increments of ten (Ex. 1492, 1482, 1472, etc).

To find the proper MTU Size, you'll have to do a special ping of the destination you're trying to go to. A destination could be another computer, or a URL.

- Click on **Start** and then click **Run**.
- Windows® 95, 98, and Me users type in **command** (WindowsR NT, 2000, XP, VistaR, 7, 8.x, and 10 users type in **cmd**) and press **Enter** (or click **OK**).
 - Once the window opens, you'll need to do a special ping. Use the following syntax: **ping [url] [-f] [-l] [MTU value]**
Example: **ping yahoo.com -f -l 1472**

```
C:\>ping yahoo.com -f -l 1482
Pinging yahoo.com [66.94.234.13] with 1482 bytes of data:
Packet needs to be fragmented but DF set.
Packet needs to be fragmented but DF set.
Packet needs to be fragmented but DF set.
Packet needs to be fragmented but DF set.

Ping statistics for 66.94.234.13:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms

C:\>ping yahoo.com -f -l 1472
Pinging yahoo.com [66.94.234.13] with 1472 bytes of data:
Reply from 66.94.234.13: bytes=1472 time=93ms TTL=52
Reply from 66.94.234.13: bytes=1472 time=109ms TTL=52
Reply from 66.94.234.13: bytes=1472 time=125ms TTL=52
Reply from 66.94.234.13: bytes=1472 time=203ms TTL=52

Ping statistics for 66.94.234.13:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 93ms, Maximum = 203ms, Average = 132ms

C:\>
```

You should start at 1472 and work your way down by 10 each time. Once you get a reply, go up by 2 until you get a fragmented packet. Take that value and add 28 to the value to account for the various TCP/IP headers. For example, let's say that 1452 was the proper value, the actual MTU size would be 1480, which is the optimum for the network we're working with ($1452+28=1480$).

Once you find your MTU, you can now configure your router with the proper MTU size.

To change the MTU rate on your router follow the steps below:

- Open your browser, enter the IP address of your router (192.168.1.1) and click **OK**.
- Enter your username (admin) and password (blank by default). Click **OK** to enter the web configuration page for the device.
- Click on **Setup** and then click **Manual Configure**.
- To change the MTU, enter the number in the MTU field and click **Save Settings** to save your settings.
- Test your email. If changing the MTU does not resolve the problem, continue changing the MTU in increments of ten.

Wireless Basics

D-Link wireless products are based on industry standards to provide easy-to-use and compatible high-speed wireless connectivity within your home, business, or public access wireless networks. Strictly adhering to the IEEE standard, the D-Link wireless family of products will allow you to access the data you want, when, and where you want it. You will be able to enjoy the freedom that wireless networking delivers.

A wireless local area network (WLAN) is a cellular computer network that transmits and receives data with radio signals instead of wires. Wireless LANs are used increasingly in both home and office environments, and public areas such as airports, coffee shops and universities. Innovative ways to utilize WLAN technology are helping people work, and communicate more efficiently. Increased mobility and the absence of cabling and other fixed infrastructure have proven to be beneficial for many users.

Wireless users can use the same applications they use on a wired network. Wireless adapter cards used on laptop and desktop systems support the same protocols as Ethernet adapter cards. Under many circumstances, it may be desirable for mobile network devices to link to a conventional Ethernet LAN in order to use servers, printers or an Internet connection supplied through the wired LAN. A wireless router is a device used to provide this link.

What is Wireless?

Wireless or Wi-Fi technology is another way of connecting your computer to the network without using wires. Wi-Fi uses radio frequency to connect wirelessly so you have the freedom to connect computers anywhere in your home or office network.

Why D-Link Wireless?

D-Link is the worldwide leader and award winning designer, developer, and manufacturer of networking products. D-Link delivers the performance you need at a price you can afford. D-Link has all the products you need to build your network.

How does wireless work?

Wireless works similarly to how cordless phones work, through radio signals that transmit data from one point A to point B. But wireless technology has restrictions as to how you can access the network. You must be within the wireless network range area to be able to connect your computer. There are two different types of wireless networks: Wireless Local Area Network (WLAN), and Wireless Personal Area Network (WPAN).

Wireless Local Area Network (WLAN)

In a wireless local area network, a device called an Access Point (AP) connects computers to the network. The access point has a small antenna attached to it, which allows it to transmit data back and forth over radio signals. With an indoor access point the signal can travel up to 300 feet. With an outdoor access point the signal can reach out up to 30 miles to serve places like manufacturing plants, industrial locations, university and high school campuses, airports, golf courses, and many other outdoor venues.

Wireless Personal Area Network (WPAN)

Bluetooth is the industry standard wireless technology used for WPAN. Bluetooth devices in WPAN operate in a range up to 30 feet away.

Compared to WLAN the speed and wireless operation range are both less than WLAN, but in return it doesn't use nearly as much power. This makes it ideal for personal devices, such as mobile phones, PDAs, headphones, laptops, speakers, and other devices that operate on batteries.

Who uses wireless?

Wireless technology has become so popular in recent years that almost everyone is using it, whether it's for home, office, business, D-Link has a wireless solution for it.

Home Uses/Benefits

- Gives everyone at home broadband access
- Surf the web, check email, instant message, etc.
- Gets rid of the cables around the house
- Simple and easy to use

Small Office and Home Office Uses/Benefits

- Stay on top of everything at home as you would at office
- Remotely access your office network from home
- Share Internet connection and printer with multiple computers
- No need to dedicate office space

Where is wireless used?

Wireless technology is expanding everywhere, not just at home or office. People like the freedom of mobility and it's becoming so popular that more and more public facilities now provide wireless access to attract people. The wireless connection in public places is usually called "hotspots".

Using a D-Link USB adapter with your laptop, you can access the hotspot to connect to the Internet from remote locations like: airports, hotels, coffee shops, libraries, restaurants, and convention centers.

Wireless network is easy to setup, but if you're installing it for the first time it could be quite a task not knowing where to start. That's why we've put together a few setup steps and tips to help you through the process of setting up a wireless network.

Tips

Here are a few things to keep in mind, when you install a wireless network.

Centralize your router or access point

Make sure you place the router/access point in a centralized location within your network for the best performance. Try to place the router/access point as high as possible in the room, so the signal gets dispersed throughout your home. If you have a two-story home, you may need a repeater to boost the signal to extend the range.

Eliminate Interference

Place home appliances such as cordless telephones, microwaves, and televisions as far away as possible from the router/access point. This would significantly reduce any interference that the appliances might cause since they operate on same frequency.

Security

Don't let your next-door neighbors or intruders connect to your wireless network. Encrypt your wireless network by turning on the WPA or WEP security feature on the router. Refer to the product manual for detail information on how to set it up.

Wireless Modes

There are basically two modes of networking:

- **Infrastructure** – All wireless clients will connect to an access point or wireless router.
- **Ad-hoc** – Directly connecting to another computer for peer-to-peer communication using wireless network adapters on each computer, such as two or more DWR-956M wireless network USB adapters.

An Infrastructure network contains an access point or wireless router. All the wireless devices, or clients, will connect to the wireless router or access point.

An Ad-hoc network contains only clients, such as laptops with wireless USB adapters. All the adapters must be in Ad-hoc mode to communicate.

Networking Basics

After you install your new D-Link adapter, by default, the TCP/IP settings should be set to obtain an IP address from a DHCP server (i.e. wireless router) automatically. To verify your IP address, please follow the steps below.

Click on **Start > Run**. In the run box type **cmd** and click **OK**. (WindowsR 7/VistaR users type **cmd** in the **Start Search** box.)

At the prompt, type **ipconfig** and press **Enter**.

This will display the IP address, subnet mask, and the default gateway of your adapter.

If the address is 0.0.0.0, check your adapter installation, security settings, and the settings on your router. Some firewall software programs may block a DHCP request on newly installed adapters.

```
C:\WINDOWS\system32\cmd.exe
Connection-specific DNS Suffix . : localhost
Wireless LAN adapter Local Area Connection* 11:
Media State . . . . . : Media disconnected
Connection-specific DNS Suffix . :
Wireless LAN adapter Local Area Connection* 14:
Media State . . . . . : Media disconnected
Connection-specific DNS Suffix . :
Wireless LAN adapter Wi-Fi:
Connection-specific DNS Suffix . :
Link-local IPv6 Address . . . . . : fe80::14d5:9f08:b952:b322%17
IPv4 Address. . . . . : 192.168.100.160
Subnet Mask . . . . . : 255.255.255.0
Default Gateway . . . . . : 192.168.100.1
C:\Users\Dawie>
```

Statically Assign an IP address

If you are not using a DHCP capable gateway/router, or you need to assign a static IP address, please follow the steps below:

Step 1

Windows® 7- Click on Start > Control Panel > Network and Internet > Network and Sharing Center > Change Adaptor Options

Windows® 8,10 - Click on Start > Search for Control Panel > Network and Internet > Network and Sharing Center > Change adaptor settings.

Step 2

Right-click on the **Local Area Connection/ Ethernet** which represents your network adapter and select Properties.

Step 3

Highlight **Internet Protocol version 4 (TCP/IP)** and click **Properties**.

Step 4

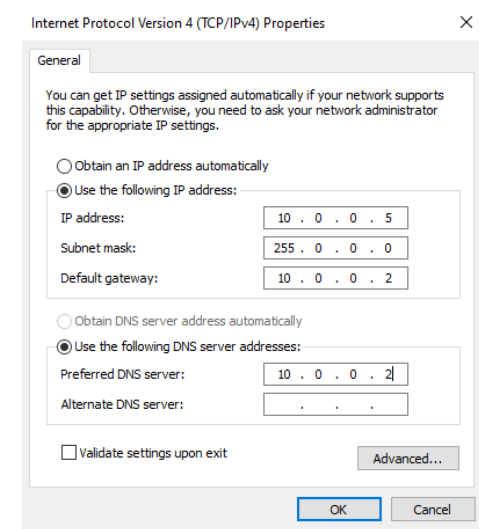

Click **Use the following IP address** and enter an IP address that is on the same subnet as your network or the LAN IP address on your router.

Example: If the router's LAN IP address is 10.0.0.2, make your IP address 10.0.0.X where X is a number between 2 and 99. Make sure that the number you choose is not in use on the network. Set the Default Gateway the same as the LAN IP address of your router (I.E. 10.0.0.2).

Set Primary DNS the same as the LAN IP address of your router (10.0.0.2). The Secondary DNS is not needed or you may enter a DNS server from your ISP.

Step 5

Click **OK** twice to save your settings.

Wireless Security

This section will show you the different levels of encryption you can use to help protect your data from intruders. The DWR-956M offers the following types of security:

- WPA2 (Wi-Fi Protected Access 2)
- WPA2-PSK (Pre-Shared Key)
- WPA (Wi-Fi Protected Access)
- WPA-PSK (Pre-Shared Key)

What is WPA?

WPA (Wi-Fi Protected Access), is a Wi-Fi standard that was designed to improve the security features of WEP (Wired Equivalent Privacy).

The 2 major improvements over WEP:

- Improved data encryption through the Temporal Key Integrity Protocol (TKIP). TKIP scrambles the keys using a hashing algorithm and by adding an integrity-checking feature, ensures that the keys haven't been tampered with. WPA2 is based on 802.11i and uses Advanced Encryption Standard (AES) instead of TKIP.
- User authentication, which is generally missing in WEP, through the extensible authentication protocol (EAP). WEP regulates access to a wireless network based on a computer's hardware-specific MAC address, which is relatively simple to be sniffed out and stolen. EAP is built on a more robust public-key encryption system to ensure that only authorized network users can access the network.

WPA-PSK/WPA2-PSK uses a passphrase or key to authenticate your wireless connection. The key is an alpha-numeric password between 8 and 63 characters long. The password can include symbols (!?*&_) and spaces. This key must be the exact same key entered on your wireless router or access point.

WPA/WPA2 incorporates user authentication through the Extensible Authentication Protocol (EAP). EAP is built on a more robust public key encryption system to ensure that only authorized network users can access the network.

Technical Specifications

Device Interfaces

- 4 x RJ-45 Gigabit Ethernet LAN ports
- 1 x FXS RJ-11 ports
- 1 x RJ-45 Gigabit Ethernet WAN port
- 2.4 GHz and 5 GHz wireless for 802.11 a/b/g/n/ac
- 1 x USB 3.0 port

Antenna Types

- 2 external dual band detachable antennas

Standards

- IEEE 802.11a
- IEEE 802.11b
- IEEE 802.11g
- IEEE 802.11n
- IEEE 802.11ac
- IEEE 802.3
- IEEE 802.3u
- IEEE 802.3ab
- IEEE 802.3az
- IEEE 802.3x
- IEEE 802.11e
- IEEE 802.1p

Wi-Fi Encryption

- WPA™ - Personal/Enterprise
- WPA2™ - Personal/Enterprise
- Wi-Fi Protected Setup (WPS) PIN/PBC

Power

- Input: 100 to 240 V AC, 50/60 Hz
- Output: 12 V DC, 1.5 A

Operating Temperature

- 0 to 40 °C (32 to 104 °F)

Storage Temperature

- -20 to 80 °C (-4 to 176 °F)

Operating Humidity

- 5% to 85% maximum (non-condensing)

Certifications

- CE

Dimensions

- 210 x 150 x 37 mm (8.26 x 5.91 x 1.46 in)

Weight

- 475.7 g (1.05 lbs)

Regulatory Information

CE EMI Class A Warning

This equipment is compliant with Class A of CISPR 32. In a residential environment this equipment may cause radio interference.

	Frequency Band(s) Frequenzband Fréquence bande(s) Bandas de Frecuencia Frequenza/e Frequentie(s)	Max. Output Power (EIRP) Max. Output Power Consommation d'énergie max. Potencia máxima de Salida Potenza max. Output Max. Output Power
